Brazil's census postponement: what the archived homepage establishes

WHAT THE SOURCE SHOWS

An extracted archive of IBGE's English homepage, captured on 30 March 2020, contains a notice dated 17 March stating that the census planned for 2020 was moved to 2021. This confirms an announced change of plan, not that enumeration actually took place in 2021.

WHY IT MATTERS

A revised census plan changes expected data availability. Keep the announcement date, revised plan and eventual completion date separate.

EVIDENCE BOUNDARY

The full news page returned 403. The evidence is an announcement item within the complete saved extraction of an official historical homepage, not the full notice or original HTML bytes. Search snippets were not used to fill in the COVID rationale, budget arrangements or eventual 2022 enumeration. Earlier media corroboration was not repeated.

Japan's household survey: revised forms and a comparability warning

WHAT THE SOURCE SHOWS

A Statistics Bureau notice dated 9 March 2018 says revised account books were introduced to half the sampled households in January. It warns about discontinuities in annual changes and contributions, provides an adjustment using propensity scores and inverse-probability weighting, and records retrospective recalculation on 8 February 2019.

WHY IT MATTERS

When comparing household spending across the change, distinguish raw and adjusted figures and their vintages before interpreting a movement as a behavioural change.

EVIDENCE BOUNDARY

The page supports the instrument change, the office's comparability warning and its adjustment. This review did not repeat media verification or examine every historical table, so it cannot establish that all level series lacked backcasting or became wholly incomparable.

Official evidence 1 →

Selected cases from existing research. This edition checks the stated claims; it does not certify every legacy event or estimate global incidence.

Document publication dates, historical captures and retrieval dates are kept separate. Sources, locators and full limitations accompany the local edition.

Greece suspended the GDP flash release, while provisional data remained scheduled

WHAT THE SOURCE SHOWS

On 4 August 2017, ELSTAT suspended its GDP flash release at 45 days after the quarter and cancelled the second-quarter flash scheduled for 14 August. The same note kept provisional second-quarter data scheduled for 1 September. This is a suspension of the flash publication, not of all GDP statistics.

WHY IT MATTERS

Different releases of one indicator have different availability. A generic GDP stoppage label would misstate which information was missing.

EVIDENCE BOUNDARY

The official note establishes the decision and the remaining schedule. This review did not separately verify the actual 1 September release, the suspension's eventual duration or the earlier media citations, and does not infer political motives.

Official evidence 1 →

South Africa resumed insolvency statistics with an explicit series break

WHAT THE SOURCE SHOWS

Stats SA says its first resumed monthly insolvency release was published on 21 July 2026, covering June and including a series from January 2023. It explicitly identifies a gap from September 2021 to December 2022 and says the release is not a continuation of the earlier series. Liquidation statistics continued separately.

WHY IT MATTERS

Resumed publication does not automatically restore a complete continuous series. Distinguish insolvencies of individuals and partnerships, liquidation statistics and the stated gap when joining observations.

EVIDENCE BOUNDARY

This check supports the announced resumption and explicit break, not a specific methodological change inferred from a gap alone. The current-period PDF request returned short HTML despite HTTP 200. The next issue's date and the old record's precise November 2021 suspension month were not rechecked. Row r1-392 is a lifecycle link, not another fully reviewed event.

Three surveys, two quarters: six reports under one catch-up episode

WHAT THE SOURCE SHOWS

In an archived PBOC index captured on 9 July 2024, all six third- and fourth-quarter 2023 reports for the depositor, entrepreneur and banker surveys carry a 22 March 2024 posting label. Six preserved official report pages show the same date. This card retains the ledger's delay-and-catch-up classification for E053 while keeping the three survey series as child records of one episode.

WHY IT MATTERS

Reference periods and posting labels are different dimensions. Keeping both helps distinguish the period measured, the date displayed by the publisher and historically evidenced visibility, while avoiding three independent-disruption counts for a shared episode.

EVIDENCE BOUNDARY

22 March is the displayed posting date, not independently proven first public accessibility. The July archive establishes that the links were present by then. The inherited 9 October 2023 due date is cadence-based and is not independently confirmed here; no exact delay duration or survey-result change is inferred. The inherited without-month tier remains unchanged.

Two receivables-definition changes: similar names, different measures

WHAT THE SOURCE SHOWS

The NBS industrial-profits release dated 27 March 2019 explains that monthly accounts receivable was replaced that year by the combined notes-and-accounts-receivable measure. The release dated 27 March 2020 explains a switch back to accounts receivable. Both tie the adjustment to alignment with enterprise financial-statement formats.

WHY IT MATTERS

These measures should not be joined solely because their names are similar. Recording the definition and the release version in which it changes helps users assess comparability across time.

EVIDENCE BOUNDARY

This confirms the definition substitutions in the official releases, not every historical value, back series or dissemination channel. March 2019 and March 2020 identify the relevant release months, not the statistical reference period or proven first access. E008 and E013 remain separate events despite appearing on one card.

A collective-enterprise breakdown ended; the aggregate releases continued

WHAT THE SOURCE SHOWS

The NBS industrial-value-added release dated 14 March 2019 and industrial-profits release dated 27 March both state that the collective-enterprise breakdown would no longer be published from 2019. Both releases still contain their respective aggregate results, so the event concerns withdrawal of a registration-type breakdown.

WHY IT MATTERS

Users comparing a business category over time need to know when its public breakdown ends. Distinguishing that breakdown from continuing aggregates avoids overstating the data gap.

EVIDENCE BOUNDARY

The finding is limited to the collective-enterprise breakdown explicitly addressed in these two releases. The publisher cites its declining share; no further motive is inferred, and unexamined channels may retain related statistics. E007 remains one event spanning two release series.
